DOCSIS 3.0 Overview

- DOCSIS 3.0 Specification(s)
 - ✓ DOCSIS 3.0 Interface Specifications (Released December 2006)
 - ✓ Equipment readily available
- Downstream data rates of 160 Mbps or higher
 - ✓ Channel Bonding
 - ✓ 4 or more channels
- Upstream data rates of 120 Mbps or higher
 - ✓ Channel Bonding
 - ✓ 4 or more channels
- Internet Protocol version 6 (IPv6)
 - ✓ *Current System (IPv4) is limited to 4.3B numbers*
 - ✓ IPv6 greatly expands the number of IP addresses
 - Expands IP address size from 32 bits to 128 bits
 - IPv6 supports 3.4×10^{38} addresses; **4923:2A1C:0DB8:04F3:AEB5:96F0:E08C:FFEC**
 - Colon-Hexadecimal Format
- 100% backward compatible with DOCSIS 1.0/1.1/2.0

DOCSIS Comparison

Version	Downstream						Upstream				
	Channel configuration				DOCSIS throughput	EuroDOCSIS throughput	Channel configuration				Throughput
	Minimum selectable number of channels	Minimum number of channels that hardware must be able to support	Selected number of channels	Maximum number of channels			Minimum selectable number of channels	Minimum number of channels that hardware must be able to support	Selected number of channels	Maximum number of channels	
1.x	1	1	1	1	42.88 (38) Mbit/s	55.62 (50) Mbit/s	1	1	1	1	10.24 (9) Mbit/s
2.0	1	1	1	1	42.88 (38) Mbit/s	55.62 (50) Mbit/s	1	1	1	1	30.72 (27) Mbit/s
3.0	1	4	m	No maximum defined	$m \times 42.88$ ($m \times 38$) Mbit/s	$m \times 55.62$ ($m \times 50$) Mbit/s	1	4	n	No maximum defined	$n \times 30.72$ ($n \times 27$) Mbit/s

DOCSIS[®] 3.0 Assumed Downstream RF Channel Transmission Characteristics

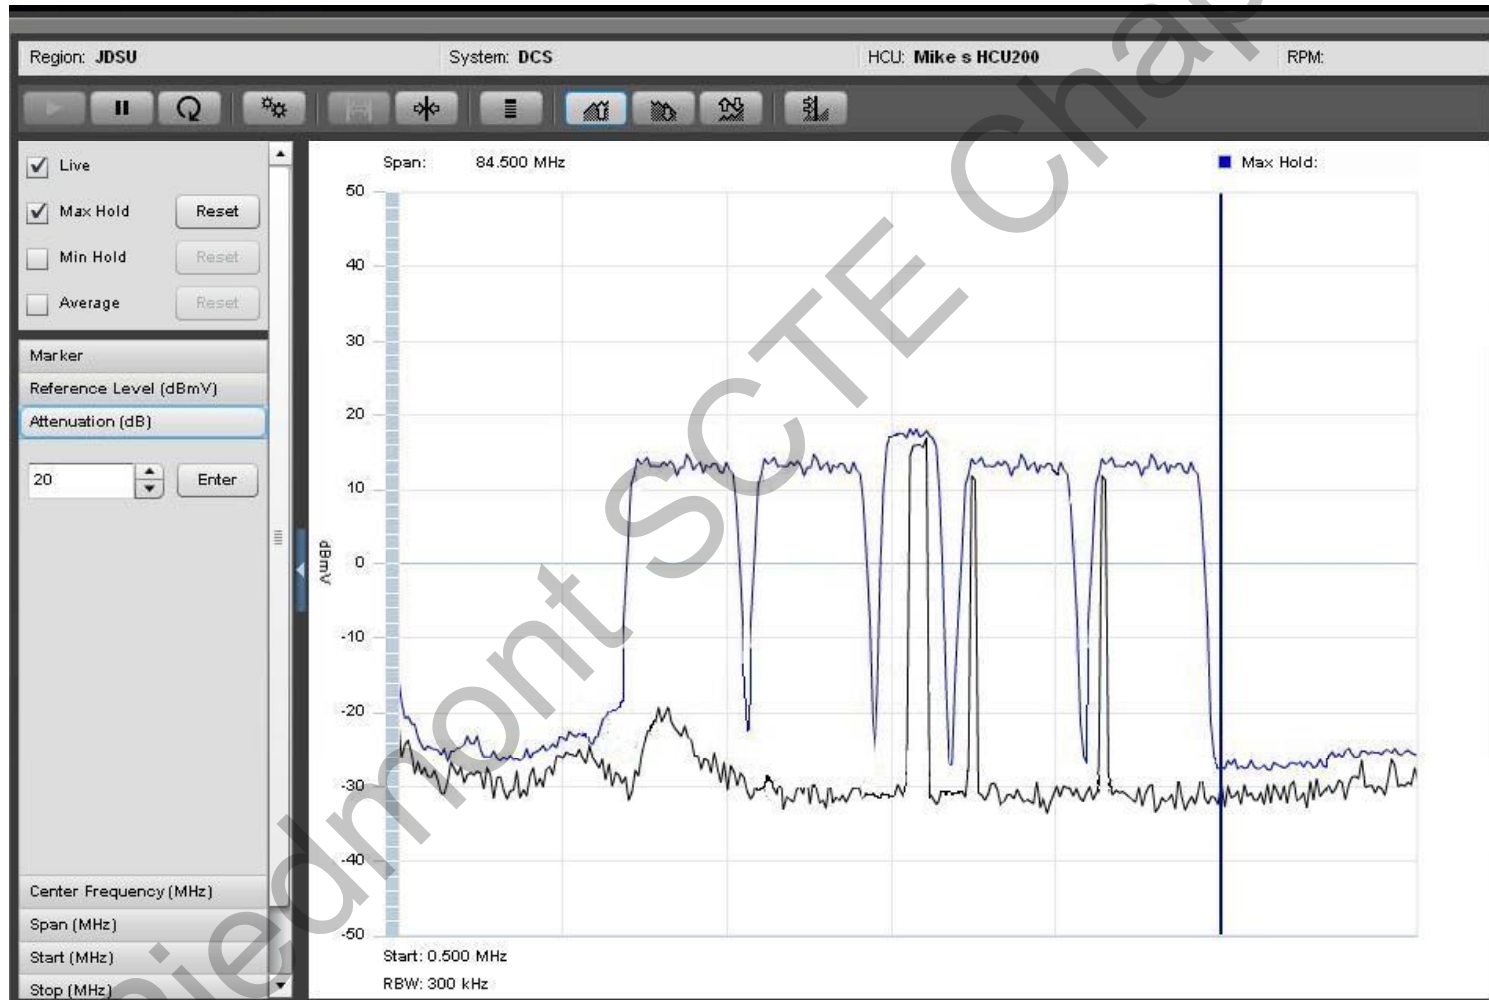

Parameter	Value
Frequency range	108 to 1002 MHz edge to edge
RF channel spacing (design bandwidth)	6 MHz
Transit delay from head-end to most distant customer	≤ 0.800 ms (typically much less)
Carrier-to-noise ratio in a 6 MHz band	Not less than 35 dB
Carrier-to- CTB, CSO, X-MOD, Ingress	Not less than 41 dB
Amplitude ripple	3 dB within the design bandwidth
Group delay ripple in the spectrum occupied by the CMTS	75 ns within the design bandwidth
Micro-reflections bound for dominant echo	-10 dBc@ ≤ 0.5 μsec -20 dBc@ ≤ 1.5 μsec -30 dBc@ > 1.5 μsec
Maximum analog video carrier level at the CM input	17 dBmV

DOCSIS® 3.0 Assumed Upstream RF Channel Transmission Characteristics

Parameter	Value
Frequency range	5 to 85 MHz edge to edge
Carrier-to-interference plus ingress ratio	Not less than 25 dB
Carrier hum modulation	Not greater than -23 dBc (7%)
Burst noise	Not longer than 10 µsec at a 1 kHz average rate for most cases
Amplitude ripple 5-42 MHz	0.5 dB/MHz
Group delay ripple 5-42 MHz	200 ns/MHz
Micro-reflections—single echo	-10 dBc@ ≤ 0.5 µsec -20 dBc@ ≤ 1.0 µsec -30 dBc@ > 1.0 µsec
Seasonal and diurnal reverse gain (loss) variation	Not greater than 14 dB min to max

The Bonded Upstream

Power Variance – 6dB Bonded vs. Unbonded

DOCSIS 3.0 Cable Modem 1 Channel Transmit Power Levels

Constellation	Constellation Gain G_{const} Relative to 64 QAM (dB)	P_{min} (dBmV)			P_{max} (dBmV) TDMA	P_{max} (dBmV) S-CDMA	$P_{min} - G_{const}$ (dBmV)	$P_{max} - G_{const}$ (dBmV) TDMA	$P_{max} - G_{const}$ (dBmV) S-CDMA
		L	M	H					
QPSK	-1.18	17	20	23	61	56	18.18	62.18	57.18
8 QAM	-0.21	17	20	23	58	56	17.21	58.21	56.21
16 QAM	-0.21	17	20	23	58	56	17.21	58.21	56.21
32 QAM	0.00	17	20	23	57	56	17.00	57.00	56.00

128 QAM	0.05	17	20	23	N/A	56	16.95	N/A	55.95

(P_{min} is a function of Modulation Rate, with L = 1280 kHz, M = 2560 kHz, and H = 5120 kHz.)

DOCSIS 3.0 Cable Modem 4 Channel Transmit Power Levels

Constellation	Constellation Gain G_{const} Relative to 64 QAM (dB)	P_{min} (dBmV)			P_{max} (dBmV) TDMA	P_{max} (dBmV) S-CDMA	$P_{min} - G_{const}$ (dBmV)	$P_{max} - G_{const}$ (dBmV) TDMA	$P_{max} - G_{const}$ (dBmV) S-CDMA
		L	M	H					
QPSK	-1.18	17	20	23	55	53	18.18	56.18	54.18
8 QAM	-0.21	17	20	23	52	53	17.21	52.21	53.21
16 QAM	-0.21	17	20	23	52	53	17.21	52.21	53.21
32 QAM	0.00	17	20	23	51	53	17.00	51.00	53.00
64 QAM	0.00	17	20	23	51	53	17.00	51.00	53.00
128 QAM	0.05	17	20	23	N/A	53	16.95	N/A	52.95

(P_{min} is a function of Modulation Rate, with L = 1280 kHz, M = 2560 kHz, and H = 5120 kHz.)

Measuring Upstream Carrier Amplitudes

These carriers will NOT have the same peak amplitude level when measured on a typical spectrum analyzer when they are each hitting the CMTS at “0 dBmV power per channel”.

TERMINOLOGY & REGISTRATION

Downstream Terminology

- Primary Downstream Channel(s)
 - ✓ Master clock, UCD, MAPs, etc.
 - ✓ CMs Registration + PDU
- Non-Primary Capable Channel(s)
 - ✓ PDU only
 - ✓ D3.0 modems
- Downstream Service Group (DSG)
 - ✓ DS bonded CHs available to CM
- MAC Domain Descriptor (MDD)
 - ✓ Contains the Downstream Channel ID of the Primary DS Channel
- Receive Channel Configuration (RCC)
 - ✓ RCC encoding configures the CM's physical layer components to specific downstream frequencies

Upstream Terminology

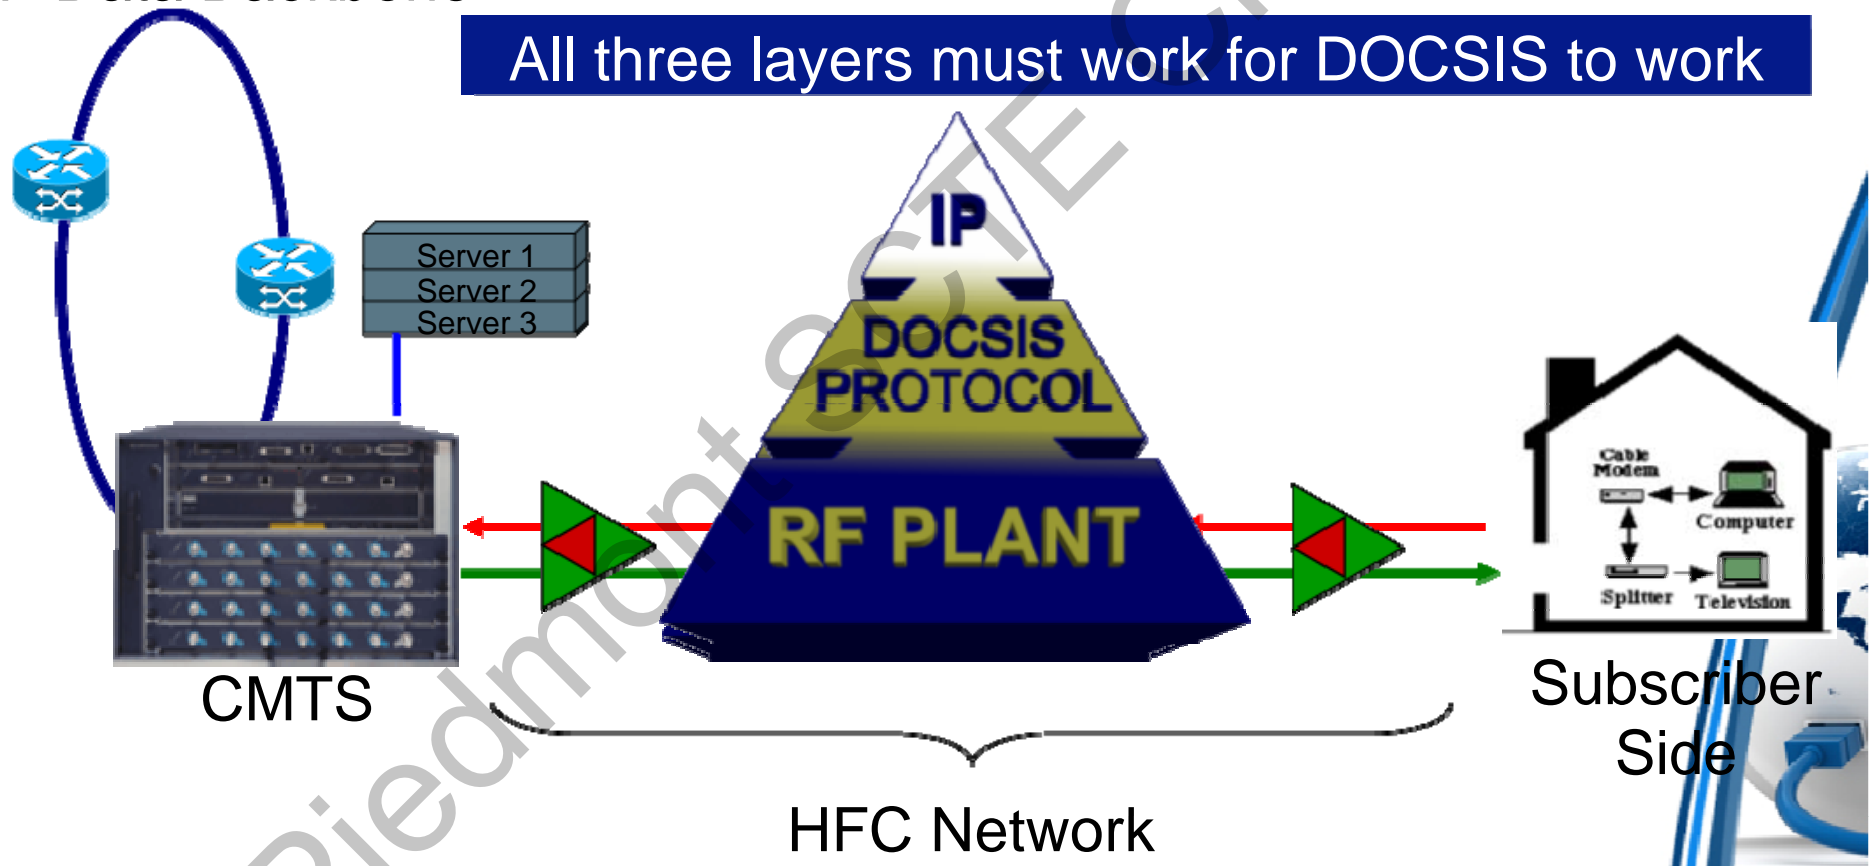

- Upstream Channel
 - ✓ Physical Upstream Channel (DOCSIS RF), or
 - ✓ Logical Upstream Channel (share same RF ch)
- Upstream Channel Descriptor – UCD
 - ✓ MAC message to CMs describing US CH
- Upstream Bonding Group (UBG)
 - ✓ Set of US bonded channels for CM
- Transmit Channel Set (TCS)
 - ✓ Set of upstream channels that a cable modem is configured to use for upstream transmission
- Transmit Channel Config (TCC)
 - ✓ Add, delete, change channels TLV

DOCSIS Communications Model

IP Data Backbone

All three layers must work for DOCSIS to work

Piedmont

Cable Modem Registration – DOCSIS 1.x/2.0

- ✓ CM registration requires the physical layer for signal transport
- ✓ DOCSIS and IP protocol layers are necessary to communicate the proper messages for modems to come online
- ✓ The next slides illustrate the interaction of these layers

Piedmont SCHE Chapter

DS Freq. Acquisition

CMTS

cable modem

Sync Broadcast
(Minimum one per 200 msec)

RNG-RSP
Ranging Response Contains:

- Timing offset
- Power offset
- Temp SID

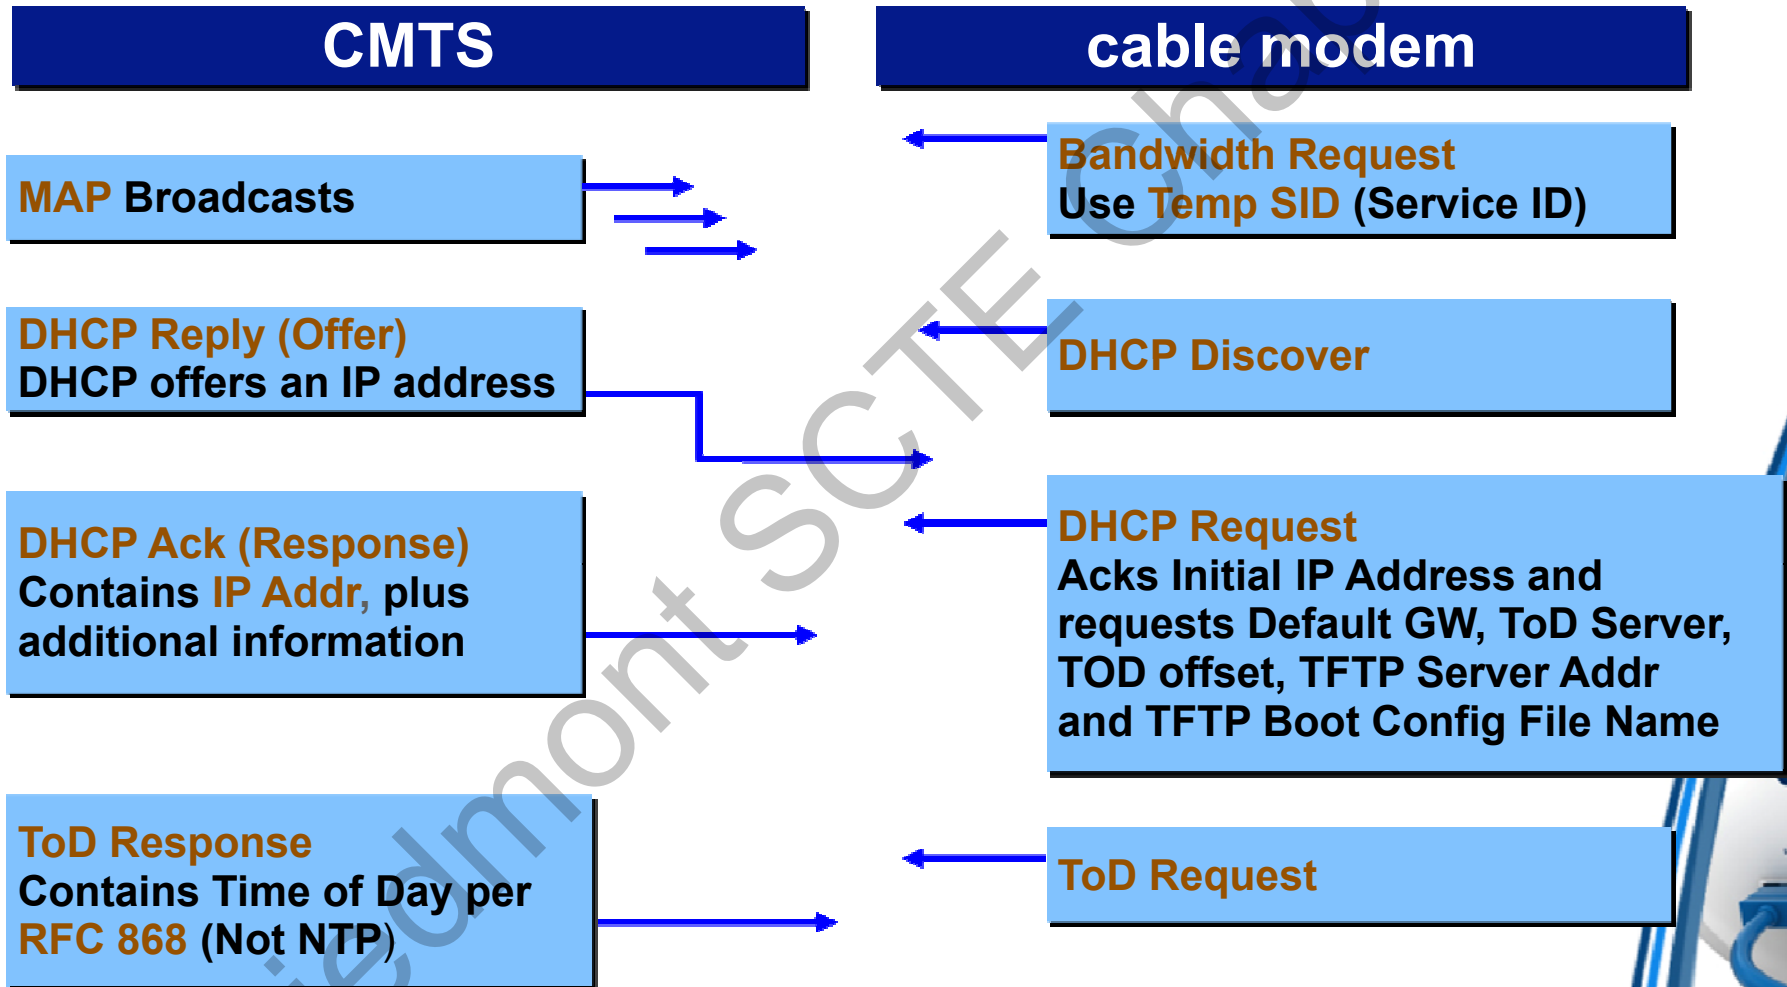

RNG-REQ
Initial Ranging Request
Sent in Initial Maintenance time Slot
Starting at 8 dBmV
Using an initial SID = 0

Wait for
RNG-RSP

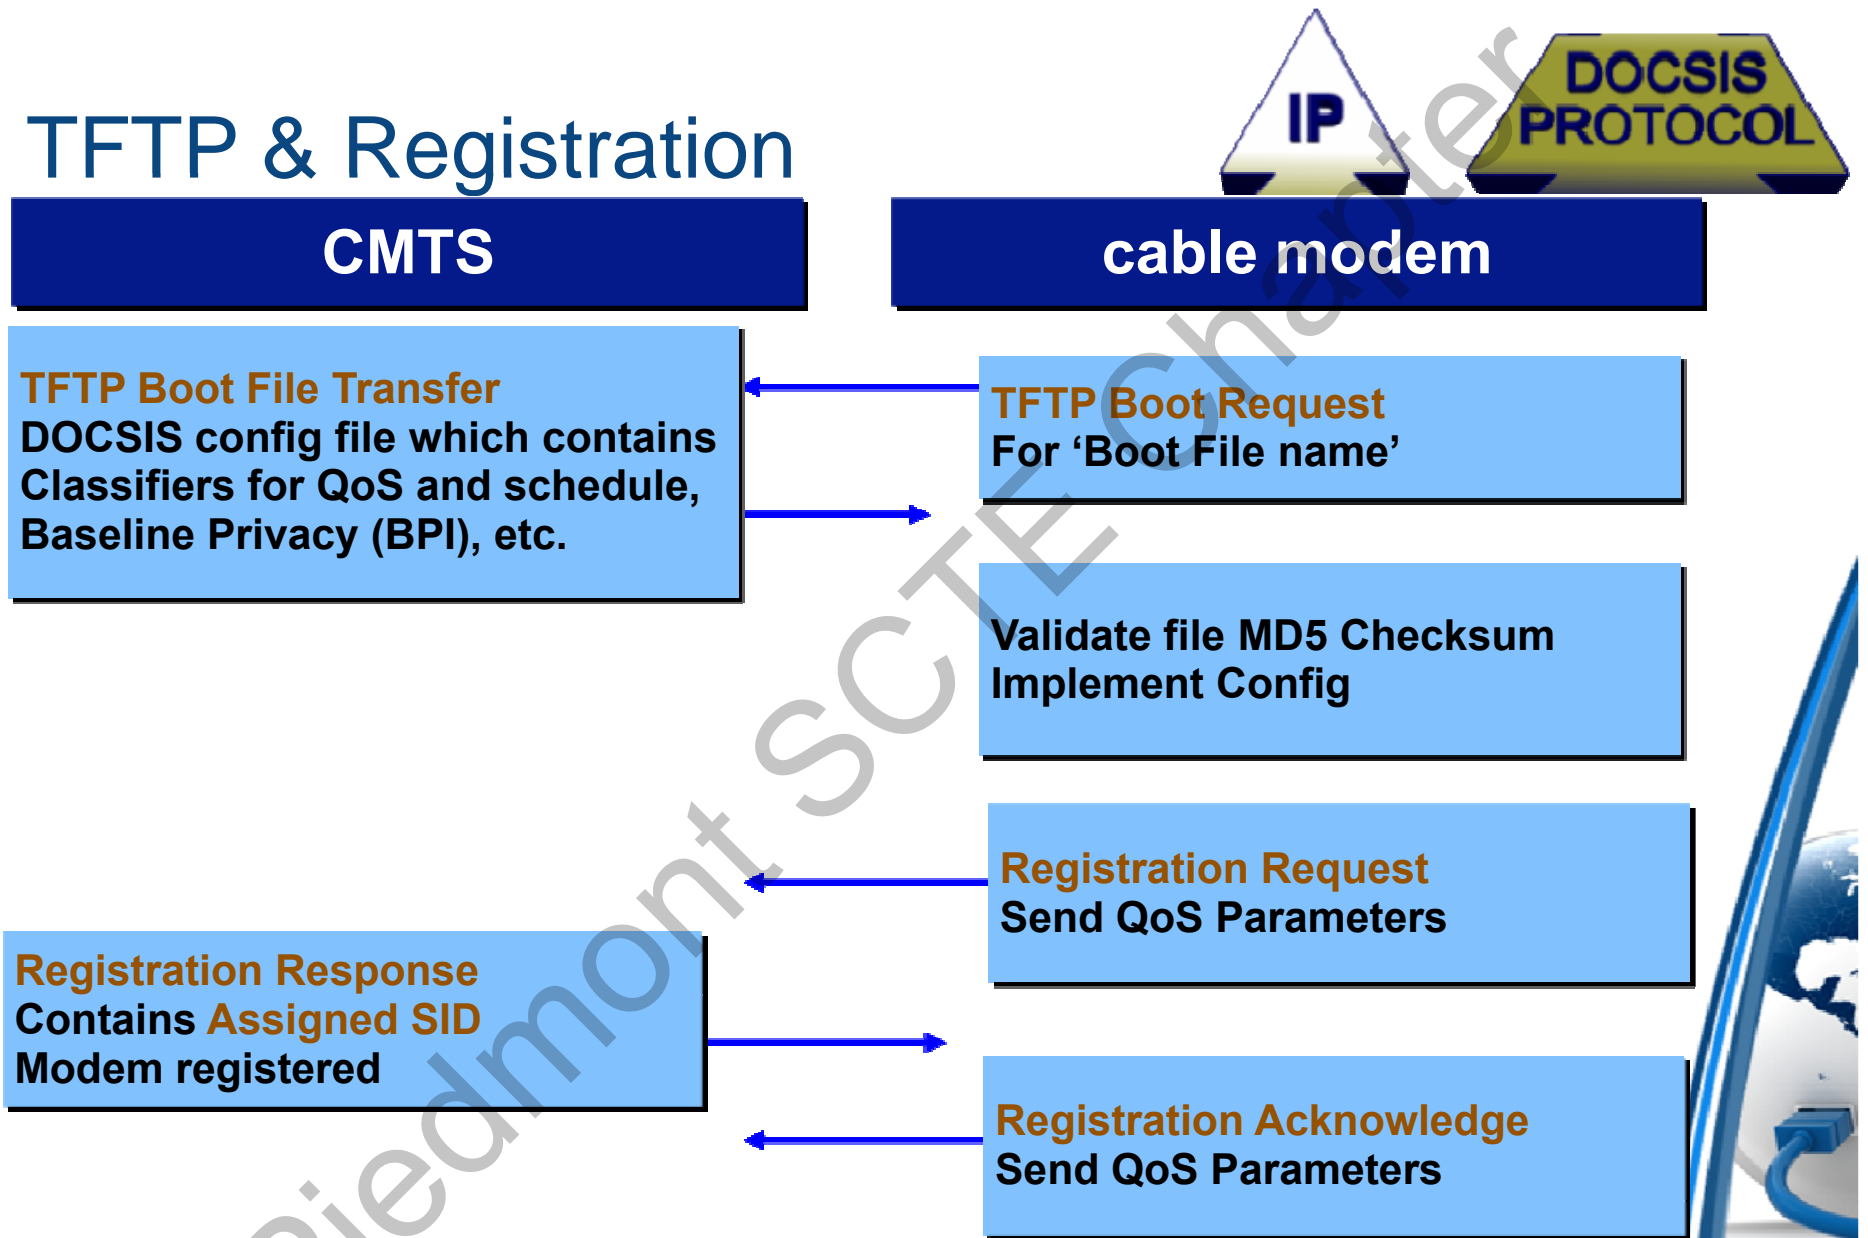

Increment by
3 dB

Adjust Timing Offset and Power Offset

DHCP Overview

TFTP & Registration

Piedmont SC TELECOM

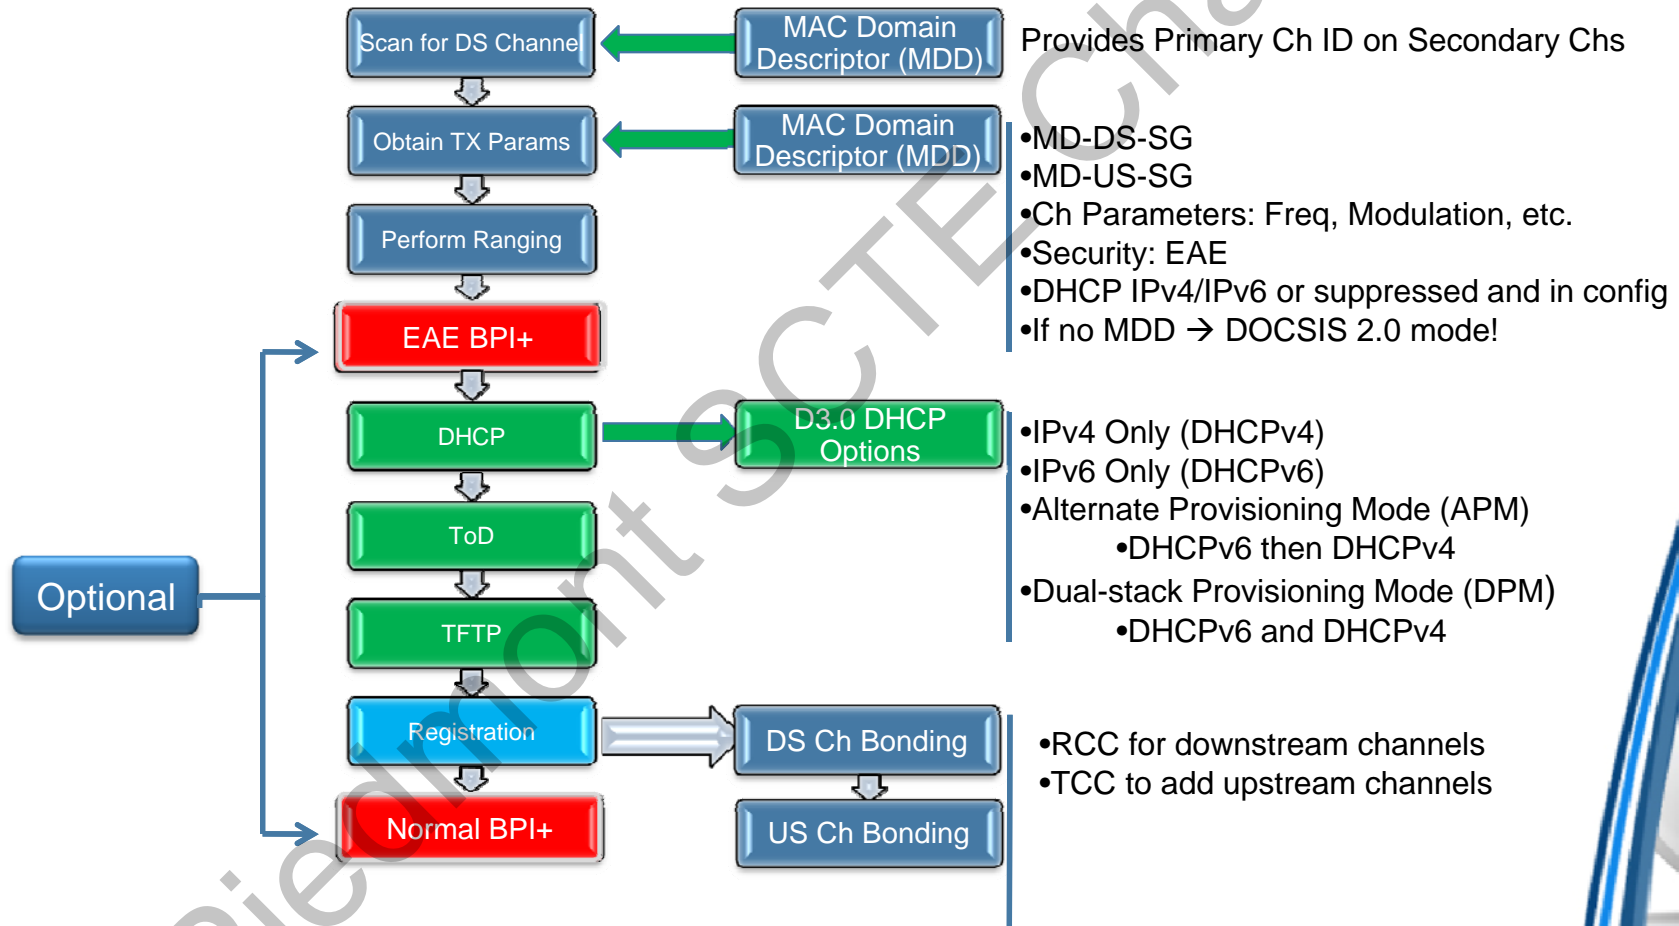

CM Registration Summary

- ✓ Downstream channel search
- ✓ Ranging
- ✓ DHCP
- ✓ ToD
- ✓ TFTP
- ✓ Registration
- ✓ Optional BPI Encryption

- ✓ Ranging occurs at least every 30 seconds when online
 - T3 timeout if Range-Request not received within 35 seconds
 - T4 timeout if Range-Response not received within 200 ms

D3.0 Modem Registration

CAIDA's IPv4 & IPv6 AS Core AS-level INTERNET GRAPH

COOPERATIVE ASSOCIATION FOR INTERNET DATA ANALYSIS
San Diego Supercomputer Center, University of California, San Diego
9500 Gilman Drive, MC0505, La Jolla, CA 92093-0505, 858-534-5000
http://www.caida.org/research/topology/as_core/network/

This visualization represents macroscopic snapshots of IPv4 and IPv6 Internet topology samples captured in 2010. The plotting method illustrates both the extensive geographical scope as well as rich interconnectivity of nodes participating in the global Internet routing system.

For the IPv4 map, CAIDA collected data from 12k monitors located in 24 countries on 6 continents. Coordinated by our active measurement infrastructure, Archipelago (Ark), the monitors probed paths toward 174 million /24 networks that cover 90% of the routable prefixes seen in the Right View® Border Gateway Protocol (BGP) routing tables on 1 August 2010.

For the IPv6 map, CAIDA collected data from 12 Ark monitors located in 6 countries on 3 continents. This subset of monitors probed paths toward 307 thousand IPv6 prefixes, which represent 99.6% of the globally routed IPv6 prefixes seen in Route Views's BGP tables on 1 August 2010. We aggregate this IP-level data to construct IPv4 and IPv6 Internet connectivity graphs at the Autonomous System (AS) level. Each AS is approximately

corresponds to an Internet Service Provider (ISP). We map each observed IP address to the AS responsible for routing traffic to it. I.e., to the origin (end-of-path) AS for the IP prefix representing the best match for this address in BGP routing tables collected from Route Views.

The position of each AS node is plotted in polar coordinates (radius, angle) calculated as follows:

$$\text{radius} = 1 - \log \frac{\text{outdegree}(\text{AS}) + 1}{\text{maximum_outdegree} + 1}$$

$$\text{angle} = \frac{\text{longitude of the AS's BGP prefixes in netacq}}{360}$$

Our IPv6 graph grew from 515 AS nodes in January 2009 to 948 nodes in August 2010 (84% growth). Over the same period, the number of ASes in our IPv4 graph grew 22%, from 23K to 28K.

Most ASes grew their observed peering degree in both our IPv4 and IPv6 graphs, although at different rates, which alters their relative degree-based rank over time. In the IPv4 graph, AS 3356 remained dominant, with the

largest observed degree in both 2009 and 2010. The second and third largest ASes, AS 174 and AS 3349, also maintained the same observed degree relative to the largest degree AS (3356) for the last two years. In contrast, ASes 2018, 701, and 1239 saw observed peering degree declines relative to the largest degree AS 3356, slipping to 4th, 5th, and 7th place. Note that we rank each AS independently; some network providers have topology spread across multiple ASes. A more accurate topology-based ranking of providers would require a validated list of AS ownership – data not currently available.

The observed IPv6 AS ranking experienced greater change. AS 6939 moved up from 2nd place in 2009 to 1st place in 2010. AS 1200 dropped from 1st to 3rd place. AS 12008 and 6172 fell out of the top ten, allowing AS 1296 and 174 to rise to 9th and 10th place. The third and fourth ranked ASes – AS1200 and AS6695 – are both exchange points rather than transit providers, reflecting the less mature state of the IPv6 topology, i.e., characterized by relatively fewer private peering relationships.

In neither 2009 nor 2010 are the top degree-ranked ASes the same across IPv4 and IPv6. The IPv4 core is Asia. This gap may reflect the geographic bias of our core includes Europe as well as the United States. We observed no high-degree "hub" IPv6 ASes in Asia.

DOCSIS IPV6

IPv6

You may not even know it happened...IPv6 Day June 8th, 2011

Ready for the future of the Internet?

No problems detected.

You don't have IPv6, but you shouldn't have problems on websites that add IPv6 support.

You should have no problems on World IPv6 Day, June 8.

SECURITY

Why better DOCSIS security?

- Various anonymous cable modem hackers have reported high success rates with zero signs of detection
 - ✓ Durandal has a machine on a business configuration that has been seeding torrents steadily for over a year
 - ✓ Many people have as many as 8 or more modems running concurrently
 - ✓ In all of these scenarios, the individuals are paying for service. They are simply splicing their line to add additional modems

Source: Defcon.org

Its beyond simple theft of service. Substantial traffic users can have a significant impact on system performance

Hacking the Cable Modem

- Which OIDs are used for hacking?
- 1.3.6.1.2.1.69.1.4.5.0
 - ✓ To figure out what the current cfg file name is for cable modem.
- 1.3.6.1.2.1.10.127.1.1.3.1.3.1
- 1.3.6.1.2.1.10.127.1.1.3.1.5.1
 - ✓ To check Up/DownStream speed of cfg file
- 1.3.6.1.2.1.69.1.4.4.0
 - ✓ To read TFTP Server IP of cable modem
- 1.3.6.1.2.1.69.1.1.3.0
 - ✓ With some software and cheap hardware – hacking is pretty darn simple in a non-BPI+ environment

BPI/BPI+ in DOCSIS 1.x / 2.0

- BPI: Baseline Privacy Interface
 - ✓ Methods for encrypting traffic between the cable modem and the CMTS with 56bit DES encryption
- BPI+: Baseline Privacy Interface Plus
 - ✓ Implemented in DOCSIS 1.1 specs (Backwards compatible)
 - ✓ Introduces X.509 v3 (RSA 1024bit) digital certificates & key pairs
 - ✓ Authentication based on certificate hardware identity; validated when modem registers with a CMTS
- Makes hacking a bit more difficult, however...
 - ✓ Operators tend to leave “Self-signed certificates on
 - ✓ During registration, there is no BPI+ security, all transactions are in the clear
 - ✓ DOCSIS 1.x and 2.0 is still exposed to security breaches
 - ✓ Even with Enforce TFTP, Masking TFTP file names, TFTP Proxy, etc.

Enhance DOCSIS 3.0 & IPv6 Security

- DOCSIS 3.0 Introduces
 - ✓ 128 bit AES traffic encryption
 - ✓ Early CM authentication and traffic encryption (EAE)
 - ✓ Source IP address verification (SAV)
 - ✓ TFTP proxy and configuration file learning
 - ✓ MMH algorithm for CMTS MIC
 - ✓ Certificate revocation
 - ✓ Encryption support of new method of multicast messaging

Security Recommendation

- Enable BPI+ and EAE
- Use BPI+ Enforce
- Disable Self-Signed Certificates
- Use “Secure Provisioning” by leveraging SAV
- Only allow CM software download via CVC
- Disable Public SNMP access
- Eliminate “Walled Garden” customer access points
 - ✓ Walled Garden sites are the primary gateway for theft-of-service
- Restrict access of your security department and policies to a limited, trusted number of people
 - ✓ Security breaches often come from within

ADVANCED TROUBLESHOOTING

Advanced Field Troubleshooting

- Why is DOCSIS 3 Troubleshooting Different?
 - ✓ Multiple Bonded Channels
 - Downstream
 - Not that different.
 - The channels are constant carrier
 - Multiple downstream channels have been around forever
 - Upstream
 - Still most vulnerable portion of plant
 - The modem is no longer limited to a single upstream transmit path
 - In some ways this is actually easier with DOCSIS 3.0

You Likely Know Your Problems

- Downstream – Typically not so bad
 - ✓ CTB, CSO, CNR under digital channels
 - ✓ Levels not correct into home (high, low, tilt)
 - ✓ Suck-outs, especially if you have contractors doing disconnects
 - ✓ Cheap modulators & upconverters never save you money
 - ✓ DOCSIS 3.0 headaches - Channel bonding, isolation, legacy
- Upstream – Your Achilles heal
 - ✓ Easy: AWGN noise, impulse noise, coherent noise, CPD, Laser clipping
 - ✓ Hard: Group delay, frequency response, micro-reflections
 - ✓ Insane: DOCSIS 3.0 – multiple upstreams – power levels
- Theft of Service

Likely Downstream Problems

- ✓ CM must lock to 4 to 8 DS channels meeting power and MER requirements of D2.0
- ✓ For M-CMTS, DTI timer must be operable
- ✓ CMTS local DS and/or eQAM DS are points of failure
- ✓ All DSs must be within 60 MHz contiguous BW
- ✓ eQAM channels must be within 24 MHz BW
- ✓ GigE interface between CMTS and eQAM is point of failure
- ✓ eQAM output is lower than conventional QAM output - headend combining may need to be changed

Piedmont SCFH Chapter

Likely Upstream Problems

- ✓ Four times the US bandwidth (four bonded channels) creates a new dynamic for troubleshooting and monitoring:
- ✓ $6.4 \text{ MHz} * 4 = 25.6 \text{ MHz}$ (without guard bands)
- ✓ Increased likelihood for laser clipping
- ✓ Increased probability for problems with ingress, group delay, micro-reflections, and other linear distortions
- ✓ Inability to avoid problem frequencies such as Citizens' Band, Ham, Shortwave, and hop between CPD 6MHz spacing
- ✓ Where are you going to put your sweep points?

Test Equipment has Advanced!

Downstream Impairments

Good MER

Noise

Gaussian noise impairments. Clusters poorly defined and spread out.

Possible Causes:

Low RF levels, low inputs to RF amplifiers

Intermittent Interference

On/Off interference below the desired QAM signal. Isolated dots appear away from the main cluster.

Possible Causes:

Laser clipping, intermittent ingress (2-way radios & paging systems)

Downstream Impairments

Compression

Non-linear distortion. Clusters are "pulled in" at the corners.

Possible Causes:

Overdriven or bad RF/IF amps, IF/RF filters, up/down converters, IF equalizers, bad clock recovery circuits

Phase Noise

Phase shift of I & Q data. The clusters appear to rotate around the center of the constellation.

Possible Causes:

Headend IF amplifiers and Up/Down converters

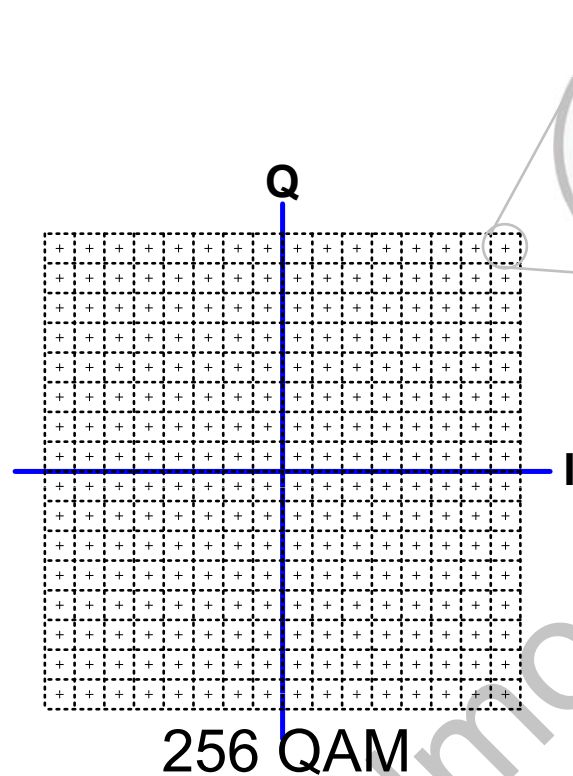

Coherent Disturbance

Interference from a signal under the desired QAM signal. Clusters appear doughnut shaped.

Possible Causes:

Ingress, CW Interference

Modulation Error Ratio (MER)

- The quality of a QAM signal can be defined by the dispersion of the constellation's points considering the target value
- The error or dispersion power is calculated by the value mean square of the error vectors (real value VS target value)
- MER is the ratio in dB between the average power of the signal and the power of the error vectors

$$MER_{\text{symp}} (dB) = 10 \cdot \log_{10} \left\{ \frac{E_{av}}{\frac{1}{N} \sum_{j=1}^N |e_j|^2} \right\}$$

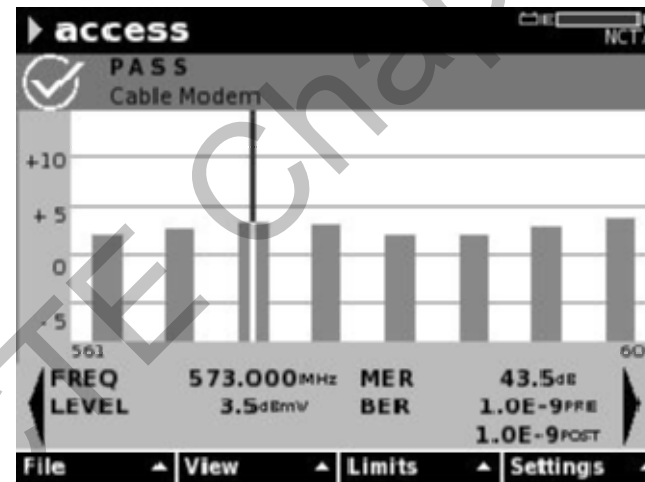

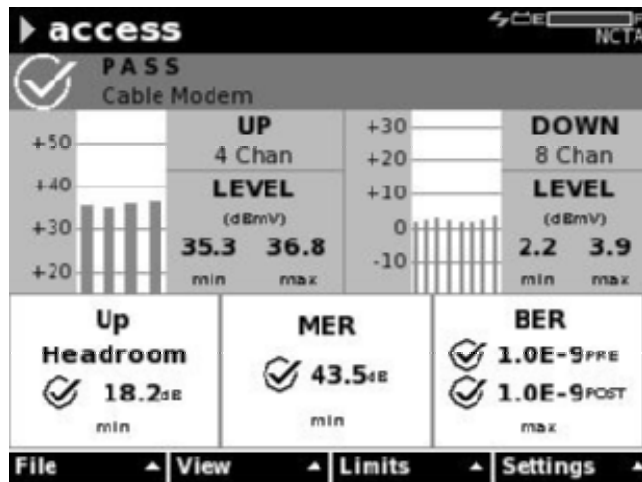

MER

BER	64-QAM MER	256-QAM MER	Quality
10^{-10}	>35	>35	Excellent
10^{-8}	27-34	31-34	Good
10^{-6}	23-26	28-30	Marginal
10^{-5}	<23	<28	Fail

Piedmont State Chapter

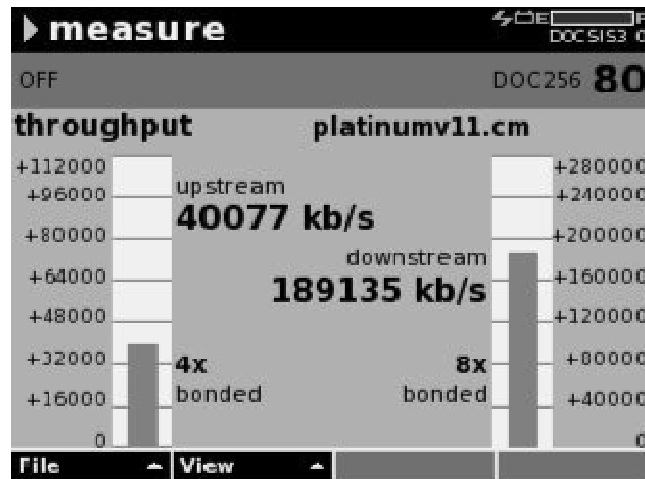

Testing DOCSIS 3.0 with a D3.0 Meter

38.5	A-TDMA	6.4MHz	QAM16	36.8	18.2

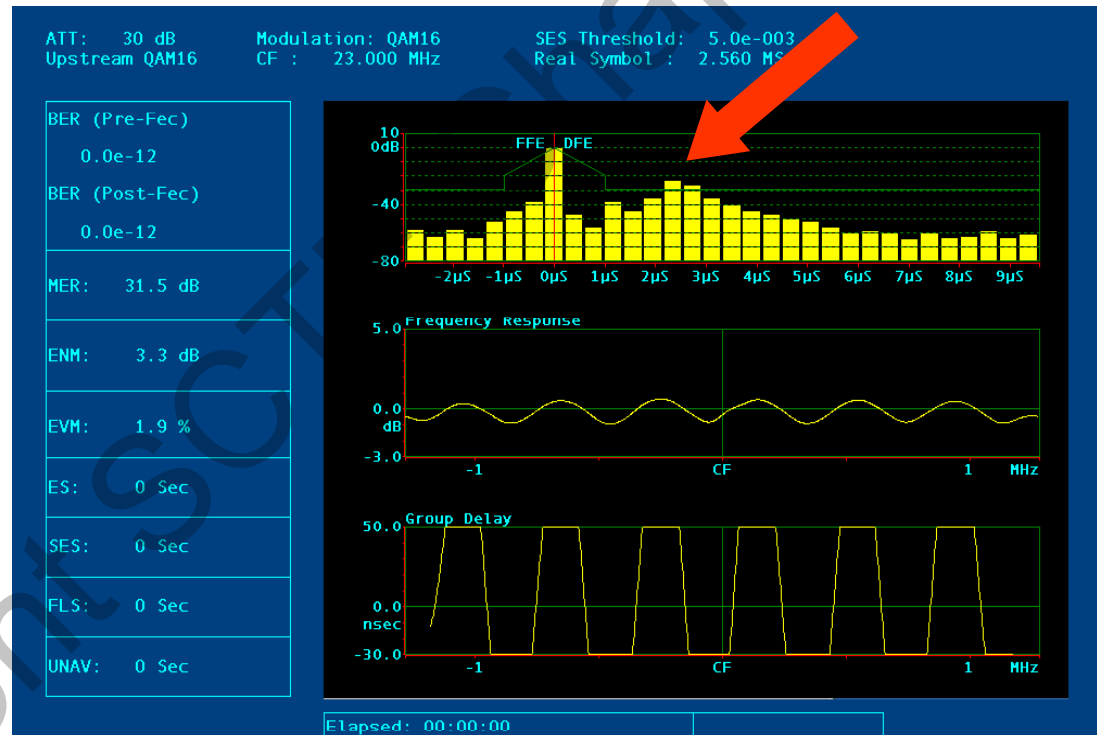

A Clean Upstream: Or Is It?

Graphic courtesy of Sunrise Telecom

Wouldn't Even Work for 16-QAM, Here's Why!

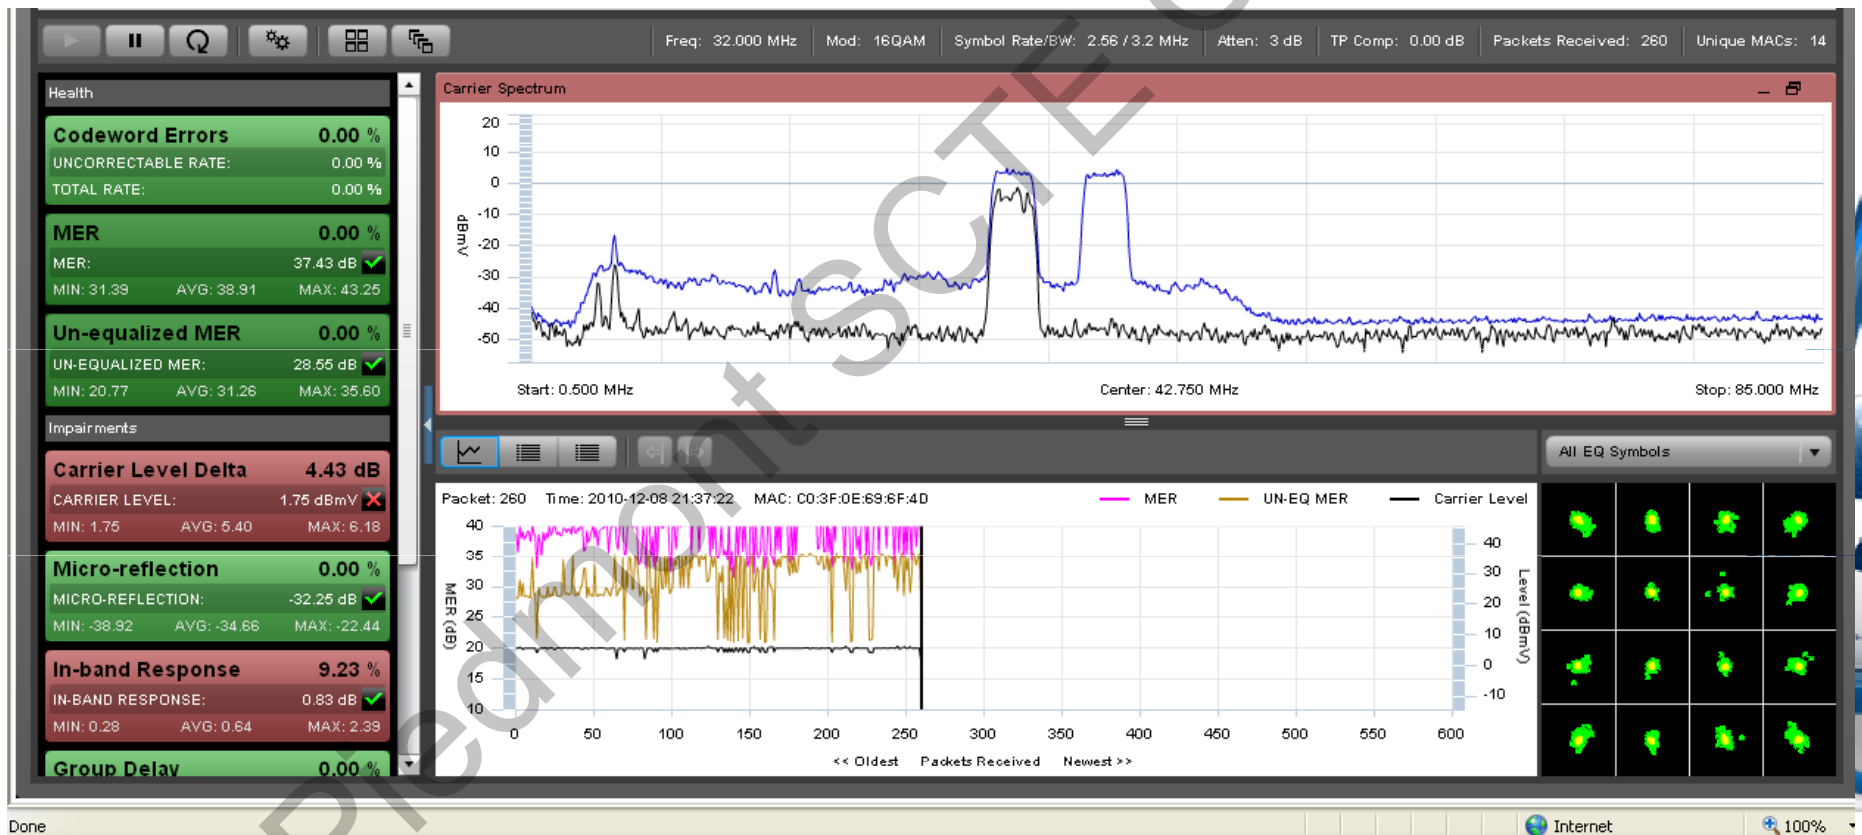

- Note ~ -22 dBc echo at 2.5 μ sec (arrow)
- Echo does not meet DOCSIS US -30 dBc at >1.0 μ sec parameter
- In-channel amplitude ripple is 1.6 dB, and group delay ripple is about 270 ns peak-to-peak

Graphic courtesy of Sunrise Telecom

What are we looking for?

- Got DOCSIS 3.0 on your mind...
 - ✓ Plan on laser clipping being a popular word

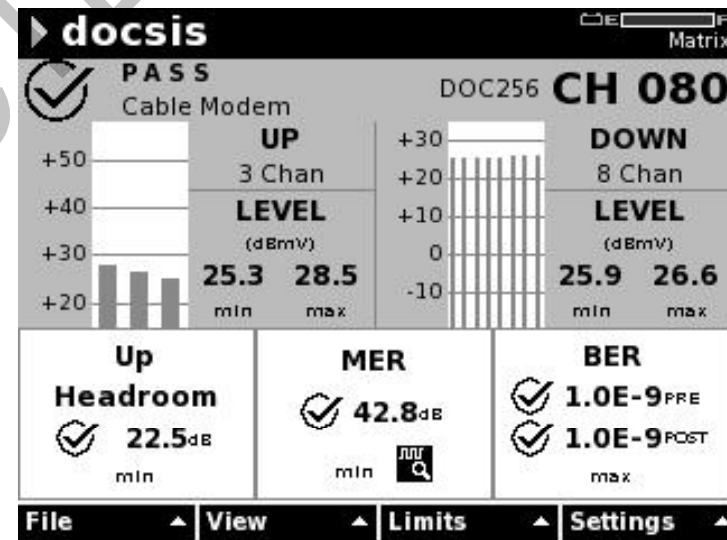

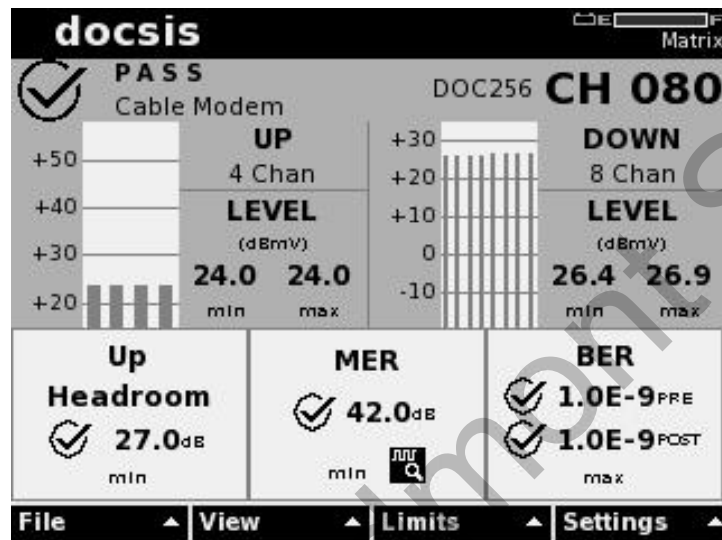

Done

Internet

100%

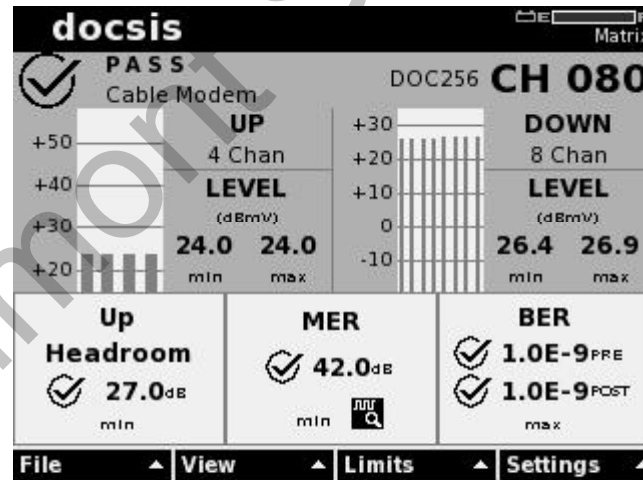

Partial Service Troubleshooting

- Partial Service exhibits itself as missing channels
- Does not exhibit as Packetloss or Throughput issue

Impaired Service Troubleshooting

- ✓ An impaired service may or may not exhibit codeword errors and packetloss
- ✓ When troubleshooting impaired service, it is critical to view the performance of the individual upstream channels.

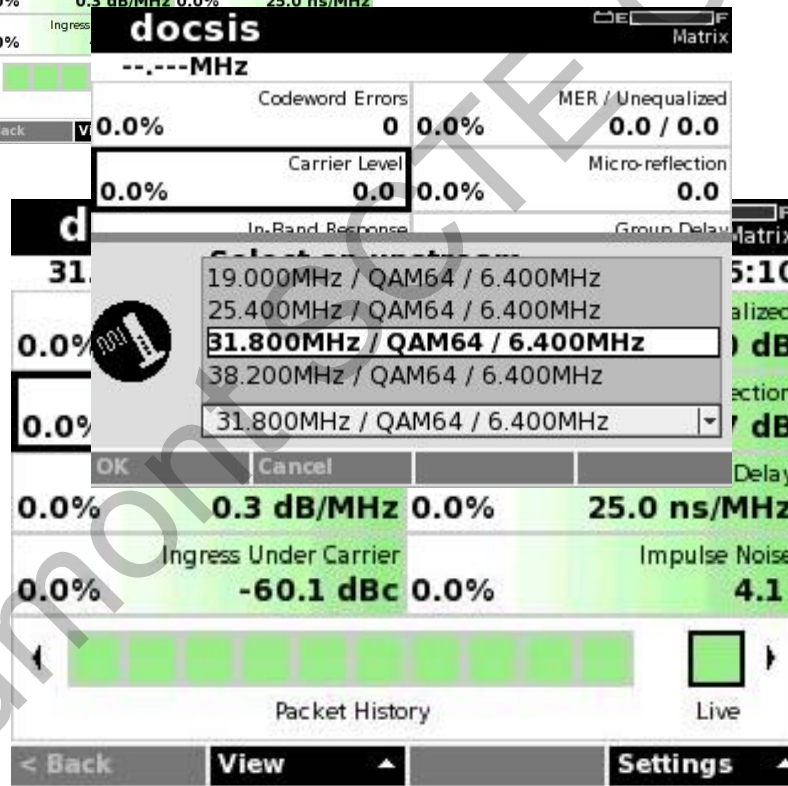

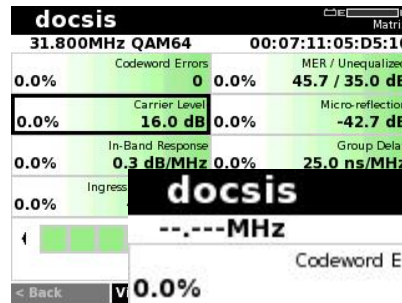

Impaired Service Troubleshooting

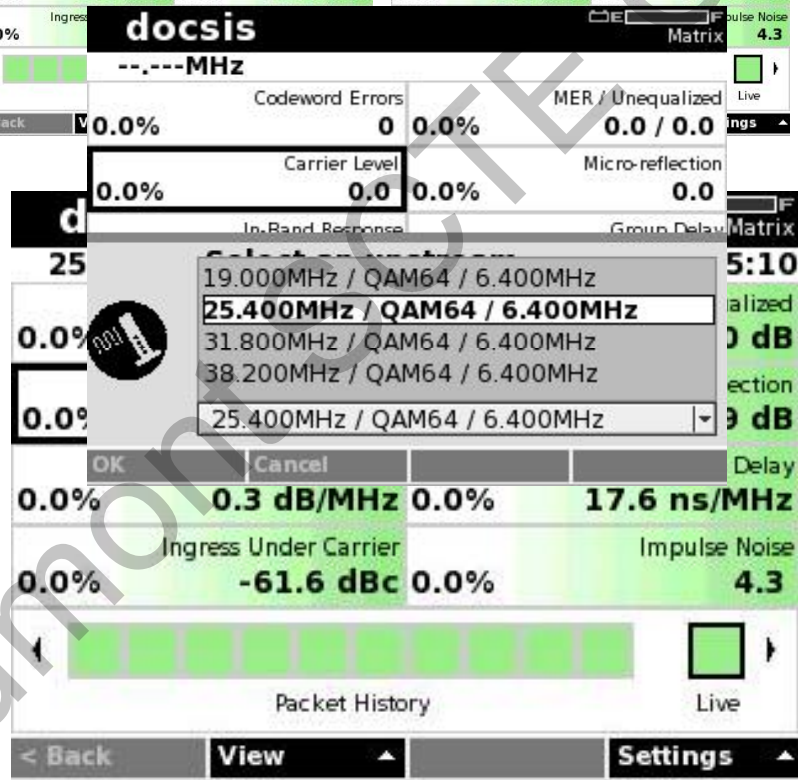

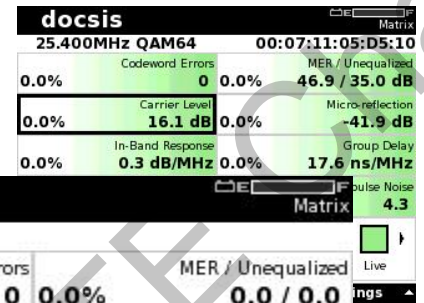

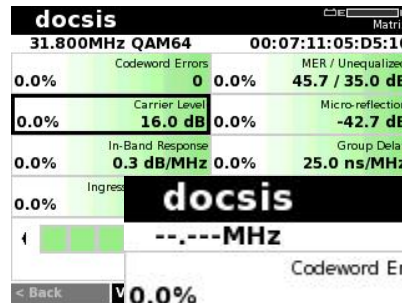

Piedmont Chapter

Impaired Service Troubleshooting

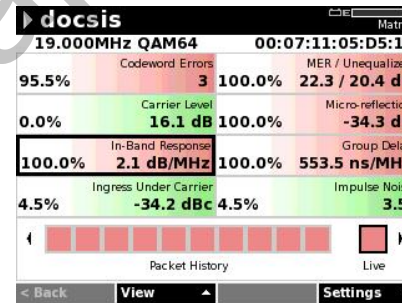

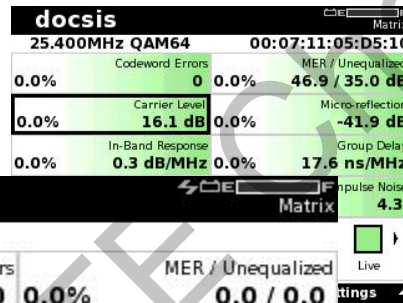

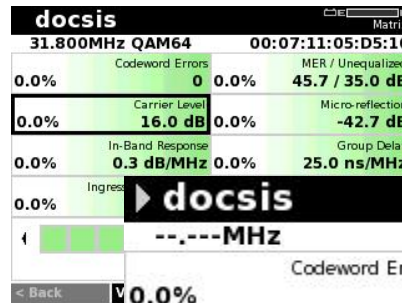

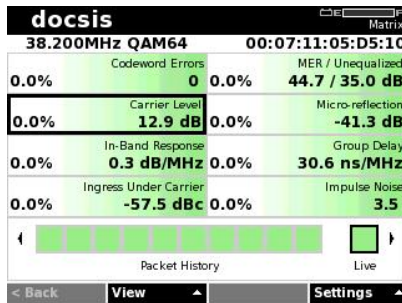

Impaired Service Troubleshooting

Impaired Service Troubleshooting

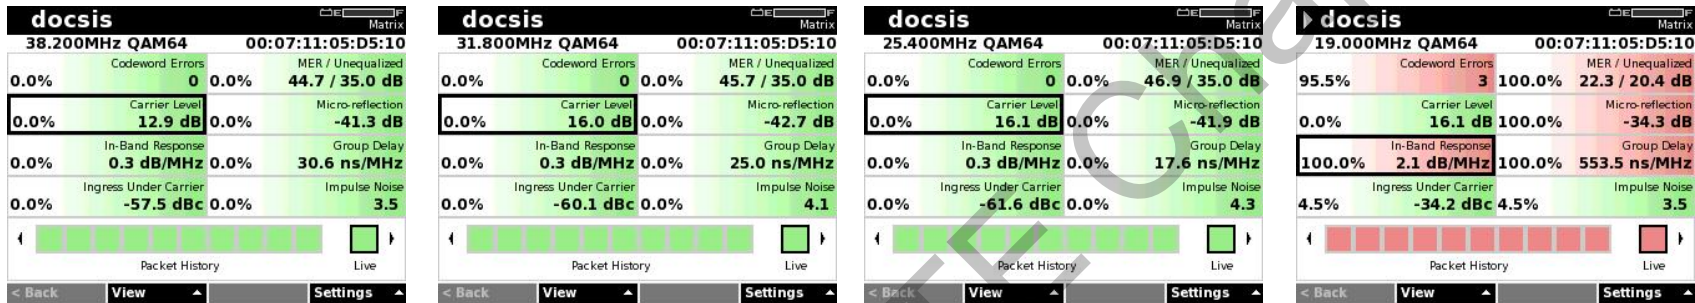

Selection menu:

- 19.000MHz / QAM64 / 6.400MHz
- 25.400MHz / QAM64 / 6.400MHz
- 31.800MHz / QAM64 / 6.400MHz
- 38.200MHz / QAM64 / 6.400MHz
- 19.000MHz / QAM64 / 6.400MHz

Performance metrics for 19.000MHz QAM64:

Codeword Errors	0.0%	MER / Unequalized	0.0 / 0.0
Carrier Level	0.0	Micro-reflection	0.0
In-Band Response	2.1 dB/MHz	Group Delay	553.5 ns/MHz
Ingress Under Carrier	4.5%	Impulse Noise	3.5

Impaired Service Troubleshooting

- Obviously there is an issue with the channel at 19 MHz
- Utilize this method to traverse the network and find the impairment causing this issue

Summary

- CMTS and SNMP data provide good troubleshooting
 - ✓ But not all of it
- DOCSIS 3.0
 - ✓ Significantly more throughput
 - ✓ Supports legacy D2.0 modems
 - ✓ D3.0 modems load balance in the upstream w/o loss of service
- Advanced test equipment is an investment that
 - ✓ Saves you time and money
 - ✓ Gets your subscribers back online and keeps them there
 - ✓ Makes you a predictable and reliable service provider
 - ✓ Seamlessly integrates headend & field – 2 places / 1 person
